**Re: Proposed Residential and Commercial Development, Greenly Drive, Cobourg, ON – Traffic Impact Study, Response to Comments**

Dear Mr. Mamone,

TRANS-PLAN is pleased to submit this Traffic Impact Study in support of the proposed residential and commercial development located at Greenly Drive in the Town of Cobourg. The proposed development consists of two land parcels, consisting of residential dwellings on the south parcel and a commercial plaza on the north parcel.

The study findings indicate that the surrounding road network can accommodate the traffic generated by the proposed development. The residential parcel is expected to have minimal impacts on the surrounding road network and the future traffic at Greenly Drive at Carlisle Street is acceptable. We recommend the east and west approaches of the private condominium laneway intersection (south of the site) on Greenly Drive to operate as a minor road (stop-controlled); and the north and south approaches operate as a major road (free-flow). Additionally, “no parking” signage should be installed on Greenly Drive between Carlisle Street and the site.

The future commercial site traffic can be accommodated by the proposed driveway and surrounding road network. Traffic activity at Elgin Street West and Rogers Road is expected function acceptably after build-out of the proposed development. No roadway improvements on Elgin Street West (other than the proposed design features) or signal timing adjustments are necessary. Details are provided herein.

Sincerely,

Anil Seegobin, P.Eng.  
Partner, Engineer

## 1. INTRODUCTION

Trans-Plan has been retained by VANDYK Group of Companies to complete a Traffic Impact Study for a proposed residential and commercial development located at Greenly Drive in the Town of Cobourg. This Traffic Impact Study includes the following study components:

- A review and assessment of the existing road network
- An assessment of boundary roadway operations under future background conditions, including a review of traffic growth, area developments and planned roadway improvements in the study area
- An assessment of site-generated traffic impacts on the study area intersections under future background and total traffic conditions
- Recommendations to mitigate any identified traffic impacts on the boundary roadways, resulting from the proposed development
- The determination of roadway and intersection improvements, as required, to accommodate the proposed development

This study responds to the submission comments received from our previous Traffic Impact Study, dated April 21, 2020, prepared by Trans-Plan.

## 2. RESPONSE TO COMMENTS

Submission comments were received from the Town of Cobourg and Northumberland County in the letter dated August 27, 2020 from the Town's Building & Planning Department. The comments are shown below in bold along with our responses:

**Town of Cobourg:**

***"Update all traffic counts (dated 2013) and provide analysis; review impacts to Rogers Road/Carlisle Street, Carlisle/Greenly, Wilkins Gate/Carlisle, Wilkins Gate/Elgin Street West and Rogers Road/Elgin Street West including traffic count and LOS review to 5 year future time horizon and include future traffic from re-development of Northumberland Mall."***

**Response:** New (2020) traffic counts were conducted at the study area intersection and driveways for our analysis, including the Carlisle Road at Rogers Road, and Carlisle Road at Wilkins Gate intersections. Details of the new traffic counts are provided in Section 5.2. The future traffic from the Northumberland Mall redevelopment was also included in our analysis, based on its Transportation Impact Study dated July 17<sup>th</sup>, 2019, prepared by LEA Consulting Ltd, to be discussed in Section 6.3.

**Northumberland County:**

***"Section 3.0 – refers to Husson Site plan – is there a new one under the new consultant's name and are there any changes? – I don't think there are, but just confirming they are relying on the most up to date Site Plan."***

**Response:** The attached site plan showing 72 proposed townhouse units is the most recent version.

***"Section 4.3 – Growth Adjustment Factor – Relying on data from LEA consulting from 2019, and shows lower Saturday peak on May 25, 2019 compared to 2013. This doesn't seem correct. Elgin Street construction may have been started at this time and it was also a long weekend, so that could be the***

***reason for less traffic. Some increase in the Saturday peak hour should be applied. The traffic counts on Elgin at Burnham that the County completed were 16,200 in 2013 and 17,200 in 2018 so there's definitely an increase in traffic, and I would expect an increase in turning movements at this intersection."***

**Response:** New (2020) traffic counts for existing conditions were conducted, but LEA's counts were referenced to determine if adjustment due to the COVID-19 pandemic was required. We note that Victoria Day was on Monday May 20, 2019 and thus LEA's Saturday count did not fall on the long weekend. Also, based on the "Public Notice: 2019 Road Construction Program" from the Northumberland County website, the 2019 construction on County Road 2 did not affect the study area. Details of the updated traffic counts and pre-pandemic vs. pandemic volume comparisons are provided in Section 5.2 and 5.3.

***"Page 9 – Elgin Street W and Canadian Tire Driveway – will be LOS F in future conditions, provide how you propose to get vehicles to use Elgin and Rogers instead of this entrance? Would require vehicles to drive through parking lot to get to Rogers Road. Does not seem like a viable solution."***

**Response:** While higher delays are expected at the driveway, it is typical of driveway connections to arterial roads. We recommend the driveway to remain as is (i.e. no improvements) because improvements such as signalization would not be warranted based on OTM Book 12 and TAC 2017 recommendations. As delays increase, drivers are likely to use the available alternative routes such as the Rogers Road signal despite the detour, which is acceptable.

***"Page 10 – in paragraph for future condition – horizon year 2025 says LOS of 0.67 and should be LOS B, based on the table."***

**Response:** The discrepancy is corrected and an updated capacity analysis based on our new (2020) counts is discussed in Section 9.

### 3. STUDY AREA CONTEXT

#### 3.1 Site Location

The subject site, shown in Figure 1, is a vacant parcel of land located along the south side of Elgin Street West. It is located approximately 300m west of the Elgin Street West and Rogers Road major intersection. The site is bounded by private residential laneways and local municipal roadways to the south. Greenly Drive currently forms a termination point at the southern site boundary.

The surrounding land uses mainly consist of low-density residential dwellings, located south and west of the site. Adjacent east of the site is a Canadian Tire retail (commercial) store. The lands north of the site, opposite from Elgin Street West, are vacant.

#### 3.2 Road Network

The study area roadways in the immediate vicinity of the site are described as follows:

**Elgin Street West**, also known as **County Road 2**, is an arterial road under the jurisdiction of Northumberland County. It runs in an east-west direction and has four travel lanes: two in each direction. The posted speed limit within the vicinity of the study area is 50km/h.

**Wilkins Gate, Greenly Drive, and Carlisle Street** are local roadways under the jurisdiction of the Town of Cobourg. Wilkins Gate and Greenly Drive run in north-south directions and Carlisle Street runs in an east-west direction. Both roadways have two travel lanes: one in each direction. The speed limit is not posted and is assumed to be 50km/h.

**Rogers Road** is a local roadway under the jurisdiction of the Town of Cobourg. It runs in a north-south direction and has two travel lanes: one in each direction, plus a two-way centre left turn lane. The speed limit is not posted and is assumed to be 50km/h.

#### 4. PROPOSED DEVELOPMENT

The site plans, prepared by Husson Engineering + Management, are shown in Figure 2 and Figure 3. The proposed development consists of two land parcels: one for low-density residential dwellings and one for a commercial plaza. The proposed commercial plaza is located on the north parcel, along Elgin Road West, and the proposed residential dwellings are on the south parcel.

The development statistics are as follows:

- 72 residential dwelling units, provided by 13 townhouse buildings and 5 semi-detached buildings
- Three (3) commercial buildings, as follows:
  - Building A (Retail Use): 2,900 sq.ft. of GFA
  - Building B (Retail Use): 6,300 sq.ft. of GFA
  - Building C (Fast-Food Restaurant with Drive-Thru): 2,200 sq.ft. of GFA
- One (1) new municipal roadway, known as Cowin Circle, that is designed as a ring road

The residential dwelling driveways are proposed on Cowin Circle. Greenly Drive is proposed to be extended beyond its existing northerly termination point to connect with Cowin Circle. The proposed commercial plaza is accessed via two driveways: one proposed right-in / right-out (“RIRO”) access on Elgin Street West and an internal connection with the adjacent Canadian Tire property.

An auxiliary eastbound right turn lane is proposed on Elgin Street West to serve the proposed RIRO driveway and the adjacent Canadian Tire driveway. The auxiliary lane will begin prior to the RIRO driveway and terminate at the Canadian Tire driveway.

The laneway connecting the residential and commercial parcels (shown as “access lane” on the site plan) is intended to be an emergency access only and regular vehicular traffic is not permitted. It can be utilized as a pedestrian connection, however.

#### 5. EXISTING CONDITIONS

##### 5.1 Study Area Intersections and Driveways

The study area intersections and driveways reviewed in our analysis are as follows:

1. Elgin Street West and Wilkins Gate (unsignalized / stop-controlled intersection)
2. Elgin Street West and Proposed Commercial Site Driveway (unsignalized / stop-controlled driveway)
3. Elgin Street West and Canadian Tire Driveway (unsignalized / stop-controlled driveway)
4. Elgin Street West and Rogers Road (signalized intersection)

5. Carlisle Street and Rogers Road (unsignalized / stop-controlled intersection)
6. Carlisle Street and Greenly Drive / Cowin Circle (unsignalized / stop-controlled driveway)
7. Carlisle Street and Wilkins Gate (unsignalized / stop-controlled intersection)

The existing roadway characteristics of the study area are shown in Figure 4, and were confirmed based on a site visit conducted by Trans-Plan on Wednesday March 18, 2020.

## 5.2 Traffic Counts

Trans-Plan conducted new (2020) turning movement counts (TMC) at the study area intersections and driveways, during the Phase 3 Provincial Reopening of the current COVID-19 pandemic. The count dates, times and peak hours are shown in Table 1. The detailed TMC data is provided in Appendix A.

Table 1 – Intersection Turning Movement Count Details

| Location                                     | Count Date                   | Count Hours                        | Peak Hours                         |
|--|------------------------------|------------------------------------|------------------------------------|
| <b>Intersections</b>                         |                              |                                    |                                    |
| Elgin Street West and Wilkins Gate           | Wednesday September 16, 2020 | 7:00am – 9:30am<br>3:00pm – 6:00pm | 8:15am – 9:15am<br>4:00pm – 5:00pm |
|  | Saturday September 19, 2020  | 11:00am – 3:00pm                   | 1:00pm – 2:00pm                    |

|  | Saturday September 19, 2020  | 11:00am – 3:00pm                   | 12:30pm – 1:30pm                   |
| Carlisle Street and Greenly Drive            | Wednesday September 16, 2020 | 7:00am – 9:30am<br>3:00pm – 6:00pm | 8:00am – 9:00am<br>4:00pm – 5:00pm |
|  | Saturday September 19, 2020  | 11:00am – 3:00pm                   | 12:45pm – 1:45pm                   |
| Carlisle Street and Wilkins Gate             | Wednesday September 16, 2020 | 7:00am – 9:30am<br>3:00pm – 6:00pm | 7:30am – 8:30am<br>3:30pm – 4:30pm |
|  | Saturday September 19, 2020  | 11:00am – 3:00pm                   | 11:15pm – 12:15pm                  |
| <b>Driveways</b>                             |                              |                                    |                                    |
| Elgin Street West and Canadian Tire Driveway | Wednesday September 16, 2020 | 7:00am – 9:30am<br>3:00pm – 6:00pm | 8:15am – 9:15am<br>3:00am – 4:00pm |
|  | Saturday September 26, 2020  | 11:00am – 3:00pm                   | 1:15pm – 2:15pm                    |

The surveyed existing traffic volumes, for the weekday AM, PM, and Saturday peak hours, are shown in Figure 5.

## 5.3 Traffic Adjustment for Pandemic

Since our 2020 TMC volumes may be affected by the pandemic, adjustment factors to scale-up the surveyed volumes were evaluated, based on past comparisons of pre-pandemic vs. pandemic TMCs. From

our experience, there is a wide variance depending on the municipality, as demonstrated by the comparisons shown in Table 2.

Table 2 – Pre-Pandemic vs. Pandemic Traffic Volumes

| Municipality & Location  | Peak Hour | Traffic Volumes, All Movements |                     | % Difference                     |
|--|-----------|--------------------------------|---------------------|----------------------------------|
|  |           | Pre-pandemic                   | Pandemic            |                                  |
| City of Richmond Hill,<br>Yonge Street at<br>Bostwick Crescent | AM        | 2112 <sup>(1)</sup>            | 1320 <sup>(2)</sup> | Pre-pandemic count is 60% higher |
|  | PM        | 2452 <sup>(1)</sup>            | 2060 <sup>(2)</sup> | Pre-pandemic count is 19% higher |
| City of Hamilton,<br>Barton Street East at<br>Chapple Street   | AM        | 871 <sup>(3)</sup>             | 736 <sup>(4)</sup>  | Pre-pandemic count is 18% higher |
|  | PM        | 1243 <sup>(3)</sup>            | 1275 <sup>(4)</sup> | Pre-pandemic count is 3% lower   |
| Town of Cobourg,<br>Elgin Street West at<br>Rogers Road        | PM        | 1768 <sup>(5)</sup>            | 1556 <sup>(6)</sup> | Pre-pandemic count is 14% higher |
|  | SAT       | 1617 <sup>(5)</sup>            | 1801 <sup>(6)</sup> | Pre-pandemic count is 10% lower  |
| Town of Cobourg,<br>Carlisle Street at<br>Rogers Road          | PM        | 718 <sup>(5)</sup>             | 561 <sup>(6)</sup>  | Pre-pandemic count is 28% higher |
|  | SAT       | 560 <sup>(5)</sup>             | 593 <sup>(6)</sup>  | Pre-pandemic count is 6% lower   |

Sources:

- (1) TMC from York Region, dated February 4, 2020
- (2) TMC by Trans-Plan, dated August 11, 2020
- (3) TMC from City of Hamilton, dated September 25, 2018
- (4) TMC by Trans-Plan, dated May 7, 2020
- (5) TMCs by LEA Consulting Ltd., dated May 24 & 25, 2019
- (6) TMCs by Trans-Plan, dated September 16 & 19, 2020

Based on the above comparisons, the following adjustment factors were applied:

- **Weekday AM Peak Hour:** An adjustment factor of +39% was applied to the Elgin Street West corridor, taken at the average percent difference during the AM from the City of Richmond Hill and City of Hamilton.
- **Weekday PM Peak Hour:** Adjustment factors of +14% and +28% were applied to the Elgin Street West and Carlisle Street corridors, respectively, based on the comparisons between our pandemic TMCs and LEA's pre-pandemic TMCs (from TIS for Northumberland Mall dated July 17<sup>th</sup>, 2019, prepared by LEA Consulting Ltd.) during the PM.
- **Saturday Peak Hour:** No adjustment factor was applied for the SAT peak hour because the pre-pandemic volumes are lower than the pandemic volumes.

While there were concerns regarding LEA's pre-pandemic TMC on Saturday May 25, 2019, we note that Victoria Day was on Monday May 20, 2019 and thus it did not fall on the long weekend. Also, based on review of "Public Notice: 2019 Road Construction Program" from the Northumberland County website, the County Road 2 construction in 2019 was between Colton Street and Union Road (approximately 28km east of the site) which does not impact the study area. Therefore, the volumes should be valid.

The adjusted existing traffic volumes, for the weekday AM, PM, and SAT peak hours, are shown in Figure 6 and were balanced (increased) for corridor volume consistency, where appropriate.

#### 5.4 Signal Timing Plans

The signal timing plan for Elgin Street West and Rogers Road was obtained from Northumberland County.

#### 5.5 Peak Hour Factors

The peak hour factors (PHF) are based on Trans-Plan's 2020 TMCs at the study area intersections and driveways, and are shown below in Table 3. The PHF of the proposed commercial site driveway was assumed to be 0.92.

Table 3 – Peak Hour Factors, Study Area Intersections and Driveways

| No. | Study Area Intersections and Driveways                  | Weekday AM Peak Hour | Weekday PM Peak Hour | Saturday Peak Hour |
|-----|---|----------------------|----------------------|--------------------|
| 1   | Elgin Street West and Wilkins Gate                      | 0.92                 | 0.98                 | 0.88               |
| 2   | Elgin Street West and Proposed Commercial Site Driveway | 0.92                 | 0.92                 | 0.92               |
| 3   | Elgin Street West and Canadian Tire Driveway            | 0.95                 | 0.90                 | 0.99               |

| 7   | Carlisle Street and Wilkins Gate                        | 0.92                 | 0.91                 | 0.82               |

### 6. FUTURE BACKGROUND CONDITIONS

The future study area roadway characteristics, with the inclusion of the proposed auxiliary lane on Elgin Street West, is shown in Figure 7. The future background traffic volumes, for the weekday AM and PM and SAT peak hours, are shown in Figure 8 and were determined based on review of the following:

- Horizon Year(s)
- Background Growth Rate along the Elgin Street West Corridor
- Background Developments within or nearby the study area
- Planned Roadway Improvements within the study area

#### 6.1 Horizon Years

A 5-year horizon period (i.e. year 2025) was utilized for our analysis of future traffic conditions.

#### 6.2 Background Growth Rate

The County Road 2 Class EA for Hamilton Road to William Street / Burnham Street ("EA Study"), dated May 2016 and prepared by HDR Inc., indicated a growth rate of 1.8 percent per annum for the Elgin Street West corridor. An excerpt of the EA Study is provided in Appendix B. The growth rate (compounded annually) was applied to the Elgin Street West corridor in our analysis of future conditions.

### 6.3 Background Developments

To address the Town's comments, the future traffic of the proposed commercial addition and driveway relocation at Northumberland Mall is included into our analysis, based on trips from its Transportation Impact Study (TIS), dated July 17<sup>th</sup>, 2019; prepared by LEA Consulting Ltd. The background trips affecting the study area intersections and LEA's TIS excerpts are provided in Appendix C.

### 6.4 Roadway Improvements

The Elgin Road West corridor (County Road 2), within the study area and beyond, is planned to undergo roadway improvements. The construction timeline is unavailable, based on review of the Northumberland County website, but the roadway improvements were included into our analysis of future conditions. The conceptual plan and profile drawings provided in the County Road 2 Class EA for Hamilton Road to William Street / Burnham Street ("EA Study"), dated May 2016 and prepared by HDR Inc., were reviewed. The drawing excerpts are provided in Appendix B.

Based on the drawings in the EA Study, in contrast to the existing roadway characteristics, the following design features are planned:

- **Elgin Street West and Wilkins Gate:** The addition of an exclusive eastbound right-turn lane, compared to a shared through / right turn lane in existing conditions.
- **Elgin Street West beyond 75m west of Wilkins Gate:** An additional through lane for each direction (two through lanes total per direction), compared to the one through lane per direction in existing conditions.

As shown in the site plan, an auxiliary eastbound right-turn lane is also proposed on Elgin Street West at the proposed commercial site driveway and the adjacent Canadian Tire driveway. The future study area roadway characteristics are shown in Figure 7 and were included into our analysis of future traffic conditions.

## 7. SITE TRAFFIC

### 7.1 Trip Generation

The site trips for the proposed development were generated using the Institute of Transportation Engineers ("ITE") Trip Generation manuals, 10<sup>th</sup> Edition. The site trip generation using the applicable ITE Land Use Codes ("LUC") are shown in Table 4.

Table 4 – Site Trip Generation, Residential and Commercial Parcels

| Land Use                                       | Size                       | Weekday AM Peak Hour         |           |            | Weekday PM Peak Hour         |           |            | SAT Peak Hour                |                    |            |
|--|----------------------------|------------------------------|-----------|------------|------------------------------|-----------|------------|------------------------------|--------------------|------------|
|  |                            | In                           | Out       | Total      | In                           | Out       | Total      | In                           | Out                | Total      |
| <b>Residential Parcel</b>                      |                            |                              |           |            |                              |           |            |                              |                    |            |
| Multifamily Housing (Low-Rise) LUC 220         | 72 units                   |                              |           |            |                              |           |            |                              |                    |            |

|  | Pass-by Trips (50%)        | 21                           | 21        | 42         | 17                           | 17        | 34         | 29                           | 29                 | 58         |
|  | New Trips                  | 22                           | 20        | 42         | 18                           | 16        | 34         | 30                           | 27                 | 57         |
| <b>Total New Commercial Trips</b>              |                            | <b>63</b>                    | <b>53</b> | <b>116</b> | <b>54</b>                    | <b>52</b> | <b>106</b> | <b>65</b>                    | <b>59</b>          | <b>124</b> |
| <b>Total Pass-by Commercial Trips</b>          |                            | <b>33</b>                    | <b>33</b> | <b>66</b>  | <b>29</b>                    | <b>29</b> | <b>58</b>  | <b>40</b>                    | <b>40</b>          | <b>80</b>  |

Note:

- (1) Directional distribution was unavailable in the ITE Manual and was assumed
- (2) Based on the equation provided for the “Peak Hour of Generator”

The residential parcel is expected to generate approximately 35, 44 and 45 two-way trips in the weekday AM, PM, and SAT peak hours, respectively, as shown in Figure 9.

A minor trip reduction of 5 percent was applied due to internal interactions with the proposed residential dwelling units and the adjacent commercial properties. The commercial parcel is expected to generate approximately 116, 106 and 124 new two-way trips in the weekday AM and PM and SAT peak hours, respectively, as shown in Figure 10.

Pass-by trip percentages of 25 percent and 50 percent, respectively, were applied to LUC 820 (i.e. Buildings A & B) and LUC 934 (i.e. Building C). The percentages were approximated based on the pass-by trip data in the ITE Trip Generation Handbook, 3<sup>rd</sup> Edition. The commercial parcel is expected to generate approximately 66, 58 and 80 two-way pass-by trips in the weekday AM and PM and SAT peak hours, respectively, as shown in Figure 11.

## 7.2 Trip Distribution and Assignment

The residential and commercial site trips were distributed to the surrounding road network based on existing travel patterns. Most traffic from the proposed residential dwellings are expected to access to / from the east leg of the intersection, based on existing turning volumes at Greenly Drive and Carlisle Street.

For the commercial parcel, a portion of the trips were distributed to the adjacent Canadian Tire driveways, due to the proposed internal connection. The existing directional split on Elgin Street West at the proposed commercial site driveway is approximately 50% eastbound / 50% westbound during the weekday AM and PM peak hours, and approximately 53% eastbound / 47% westbound during the SAT peak hour.

## 8. FUTURE TOTAL TRAFFIC CONDITIONS

The future 2025 total traffic volumes for the weekday AM, PM, and SAT peak hours, shown in Figure 12, were obtained by adding the site trips and pass-by trips to the future 2025 background volumes.

## 9. CAPACITY ANALYSIS

### 9.1 Analysis Methodology

A capacity analysis was performed for the study area intersections and driveways using Synchro 10 analysis software. The following traffic conditions, during the weekday AM, PM, and SAT peak hours, were analyzed:

- Existing Traffic Conditions (2020)
- Future Background Traffic Conditions (2025)
- Future Total Traffic Conditions (2025)

According to the Northumberland County Transportation Master Plan (TMP), dated March 2017, a v/c ratio of 0.7 or LOS of D is generally considered as the threshold for traffic congestion. The congested movements, if any, are identified.

### 9.2 Analysis Results

The detailed capacity analysis results are shown in Table 5 and the congested movements (if any) are noted below. The Synchro 10 output sheets and level of service (LOS) definitions are provided in Appendix D and Appendix E, respectively.

The results for each study area intersection and driveway are summarized as follows:

#### Elgin Street West & Wilkins Gate

##### ***Existing Conditions***

The northbound left movement (stop-controlled approach) currently operates acceptably with a LOS of C or better and delays of up to 20 seconds, during the peak hours.

##### ***Future Conditions – Horizon Year 2025***

The northbound left movement (stop-controlled approach) is expected to continue operating acceptably with a LOS of C and delays of up to 24 seconds under future total conditions. The Elgin Street West and New Amherst Boulevard / Loveshin Road traffic signal can provide a more efficient alternative route for left turn vehicles as the delays increase.

#### Elgin Street West & Proposed Commercial Site Driveway

##### ***Future Conditions – Horizon Year 2025***

The proposed commercial site driveway is expected to operate with a good LOS of B and minimal delays of up to 11 seconds for outbound vehicles.

#### Elgin Street West & Canadian Tire Driveway

##### ***Existing Conditions***

The northbound left movement (outbound approach) currently operates acceptably with a LOS of C and delays up to 23 seconds, during the weekday AM and SAT peak hours. It operates with a LOS of D and a delay of 28 seconds, during the weekday PM peak hour.

##### ***Future Conditions – Horizon Year 2025***

Under future total conditions, the northbound left movement (outbound approach) is expected to operate acceptably with a LOS of C during the weekday AM peak hour. It is expected to operate with LOS's of E and F, during the SAT and weekday PM peak hours, respectively, and delays of 42 and 56 seconds. While higher delays are expected, it is typical of unsignalized driveway connections to arterial roadways.

We recommend leaving the driveway as is (i.e. no improvements) because improvements such as signalization would not be warranted based on OTM Book 12 and TAC 2017 recommendations. OTM Book 12 states that the minimum distance between signalized intersections for roads with a posted speed limit of 60km/h (or less) is 215m, whereas the distance between the driveway and the Elgin Street West at Rogers Road signal is approximately 195m. TAC 2017 also recommends spacing of 400m between signals for arterial roads with a speed of 50km/h. As delays increase, drivers are likely to use the available alternative routes such as the Rogers Road signal despite the detour, which is acceptable.

#### Elgin Street West & Rogers Road

##### ***Existing Conditions***

The overall intersection currently operates acceptably during the peak hours, with an overall LOS of A and v/c ratios of up to 0.56. All individual movements operate with reserve capacity.

#### **Future Conditions – Horizon Year 2025**

The intersection is expected to continue operating acceptably in the weekday AM, PM, and SAT peak hours, under future total traffic conditions. In the weekday PM and SAT peak hours, the overall intersection is expected to operate with a v/c ratio of 0.65 and the westbound left turn movement is expected to operate with a v/c ratio of 0.70.

While the movement is considered congested according to the Northumberland County TMP, a v/c ratio of 0.70 is generally acceptable and well under the critical threshold of other municipalities and counties (e.g. v/c ratio of 0.85).

#### **Carlisle Street & Rogers Road**

##### ***Existing Conditions***

The intersection currently operates acceptably with a LOS of B or better across all movements, during the weekday AM, PM, and SAT peak hours.

##### **Future Conditions – Horizon Year 2025**

The intersection is expected to continue operating acceptably with a LOS of C or better, and delays of up to 16 seconds across all movements, during the weekday AM, PM, and SAT peak hours.

#### **Carlisle Street & Greenly Drive / Cowin Circle**

##### ***Existing Conditions***

The intersection currently operates well with a LOS of A and minimal delays across all movements, during the weekday AM, PM, and SAT peak hours.

##### **Future Conditions – Horizon Year 2025**

With the inclusion of future site traffic, the intersection is expected to continue operating with minimal delays and a LOS of A for all movements, during the peak hours. Overall, the proposed townhouses are expected to have minimal traffic impacts on the intersection and the surrounding road network.

#### **Carlisle Street & Wilkins Gate**

##### ***Existing Conditions***

The intersection currently operates well with a LOS of A and minimal delays across all movements, during the weekday AM, PM, and SAT peak hours.

##### **Future Conditions – Horizon Year 2025**

The intersection is expected to continue operating with minimal delays and a LOS of A for all movements, during the peak hours.

**Table 5 - Capacity Analysis Results, Existing and Future Traffic Conditions**

| Intersection Movement  | Existing Traffic Conditions |       |      |              |       |     | 2025 Background Traffic Conditions |       |      |              |       |     | 2025 Total Traffic Conditions |       |      |              |       |     |              |       |     |

## 10. TRANSPORTATION IMPROVEMENT RECOMMENDATIONS

### 10.1 Stop Control of Private Condominium Laneway Approaches

We recommend the east and west approaches of the private condominium laneway intersection with Greenly Drive (located between the southerly site boundary and Carlisle Street) to operate as a minor street (stop-controlled). The north and south approaches at the intersection should operate as the major street (free-flow).

### 10.2 No Parking Signage on Greenly Avenue

Concerns were expressed from the local community in the letter dated July 30, 2020, regarding the lack of a second exit for fire trucks / emergency vehicles from the private condominium laneway. As a result, we recommend “no parking” signage to be installed along Greenly Drive, between the site and Carlisle Street, to prevent potential obstructions if truck reverse movements are required from the laneway.

### 10.3 Concerns of Increased Traffic from Local Community

Another concern expressed from the local community was regarding increased traffic on Greenly Drive and Carlisle Street due to the proposed development. The letter suggested that a direct connection from the proposed townhouses to Elgin Street West would be beneficial.

However, we do not recommend a new roadway connection because the new intersection on Elgin Street West would not meet the minimum spacing requirements in the Transportation Association of Canada (TAC) Geometric Design Guide 2017, due to the proximity to Wilkins Gate and the adjacent Canadian Tire driveway. The lack of spacing would result in deficient storage and deceleration distance for left turning vehicles from Elgin Street West. The proposed commercial site driveway is acceptable because it is restricted to right-in / right-out movements, instead of full-moves.

As per TAC, the typical minimum intersection spacing on minor arterial roads is 200m, generally only applicable in areas of intense existing development or restrictive physical controls where feasible alternative do not exist. Major arterials would require an even greater distance. Elgin Street West is identified as a County Arterial Road in the Northumberland County Official Plan (OP) and better matches the characteristics of a major arterial. The distance from the new potential road to Wilkins Gate is approximately 190m (assuming an extension of Greenly Drive) which is not adequate for a major arterial. The existing Canadian Tire full-moves driveway, with greater traffic volumes than Wilkins Gate, is also approximately 80m east of the new potential road, so it is not recommended to shift the new potential intersection further east to meet the requirement.

We also do not recommend a potential vehicular connection between the commercial and residential parcels because the connection would increase traffic on Greenly Drive rather than decrease it. Because the commercial parcel generates about 4 to 5 times more traffic than the proposed townhouse units (new and pass-by trips combined, see Section 7.1), a vehicular connection would attract traffic from south of the site. The current proposal of separating the commercial and residential parcels restricts the high commercial traffic volumes to Elgin Street West, minimizing impacts to Greenly Drive and Carlisle Street.

Lastly, our capacity analysis (from Section 9) indicates that the Carlisle Street and Greenly Drive intersection is expected to operate well (LOS of A) under future conditions, with minimal delays for all

approaches. We conclude that the future traffic volumes on Greenly Drive and Carlisle Street with the proposed townhouses are acceptable for the local residential roadways.

## 11. SUMMARY AND CONCLUSIONS

### 11.1 Summary

This Traffic Impact Study prepared in support of the proposed residential and commercial development at Greenly Drive, Cobourg, is summarized as follows:

#### Proposed Development & Site Statistics

- Two (2) land parcels are proposed; the south parcel consists of low-density residential dwellings and the north parcel consists of a commercial plaza.
- 72 residential dwelling units, provided by 13 townhouse buildings and 5 semi-detached buildings, are proposed on the residential parcel.
- Three (3) commercial buildings are proposed on the commercial parcel, as follows:
  - Building A (Retail Use): 2,900 sq.ft. of GFA
  - Building B (Retail Use): 6,300 sq.ft. of GFA
  - Building C (Fast-Food Restaurant with Drive-Thru): 2,200 sq.ft. of GFA
- One (1) new municipal roadway, known as Cowin Circle, is designed as a ring road on the residential parcel. The dwelling unit driveways are proposed on Cowin Circle. The new municipal roadway is proposed to connect with the existing northerly termination point of Greenly Drive.
- One (1) right-in / right-out driveway is proposed on Elgin Street West to provide vehicular access to the proposed commercial plaza. An internal connection is also proposed to connect the commercial plaza with the adjacent Canadian Tire property.
- An auxiliary eastbound right turn lane is proposed on Elgin Street West to serve the proposed RIRO driveway and the adjacent Canadian Tire driveway. The auxiliary lane will begin prior to the RIRO driveway and terminate at the Canadian Tire driveway.

#### Traffic Impact Study

- New (2020) study area TMCs were conducted at the study area intersections and driveways, during the Phase 3 Provincial Reopening of the current COVID-19 pandemic. Adjustment factors were applied to scale up the surveyed volumes, where appropriate.
- A background growth rate of 1.8 percent per annum was applied to the Elgin Street West (also known as County Road 2) corridor, based on review of the County Road 2 Class EA from Hamilton Road to William Street / Burnham Street.
- The future traffic from the proposed Northumberland Mall redevelopment was included into our analysis as a background development.
- The planned roadway improvements noted in the County Road 2 Class EA for Hamilton Road to William Street / Burnham Street were incorporated into the analysis of future traffic conditions. The proposed eastbound right-turn auxiliary lane at the proposed commercial site driveway and the adjacent Canadian Tire driveway was also included.

- The site trips were generated utilizing the formulas in the Institute of Transportation Engineers (ITE) Trip Generation manuals, 10<sup>th</sup> Edition. Pass-by trip adjustments were applied to the proposed commercial buildings. The trips were distributed to the surrounding road network based on existing travel patterns.
- The proposed residential dwellings are expected to have minimal traffic impacts on the surrounding road network. The Carlisle Street and Greenly Drive intersection is expected to operate with minimal delays under future traffic conditions.
- The proposed right-in / right-out commercial site driveway is expected to operate with minimal delays under future traffic conditions.
- The Elgin Street West and Rogers Road intersection is expected to operate acceptably under future traffic conditions. The westbound left movement is expected to approach the threshold for congestion (i.e. v/c ratio of 0.70) in the weekday PM and SAT peak hours. However, a v/c ratio of 0.70 is generally acceptable and well under the critical threshold in other municipalities and counties (i.e. a v/c ratio of 0.85).
- The northbound left movement (outbound approach) at the Elgin Street West and Canadian Tire driveway is expected to operate with higher delays in the weekday PM and SAT peak hours, but it is typical of full-moves driveway connections to arterial roadways. We recommend the driveway to remain as is (i.e. no improvements) because improvements such as signalization would not be warranted, due to signal spacing requirements not being met. As delays increase, drivers are likely to use available alternative routes, which is acceptable.
- It is recommended that the east and west approaches of the Greenly Drive and private condominium laneway (south of the site) operate as a minor street (stop-controlled).
- “No parking” signage is recommended on Greenly Drive, to prevent obstructions if fire trucks / emergency vehicles are required to reverse from the private condominium laneways.
- A new roadway connection from the residential parcel to Elgin Street West is not recommended, because the new intersection on Elgin Street West would not meet the TAC 2017 spacing requirements.

## 11.2 Conclusions

Overall, the surrounding road network can accommodate the additional site traffic under future traffic conditions. We recommend the east and west approaches of the Greenly Drive and private condominium laneway intersection (south of the site) to operate as a minor street (stop-controlled) in the future, and “no parking” signage to be installed on Greenly Drive between the site and Carlisle Street.

Respectfully submitted,

## **APPENDIX B**

### County Road 2 Class EA, Excerpts

lane per direction. The annual growth rate used is 1.8% to reflect average growth based on the observed traffic patterns.

### **2.1.3 Future Conditions**

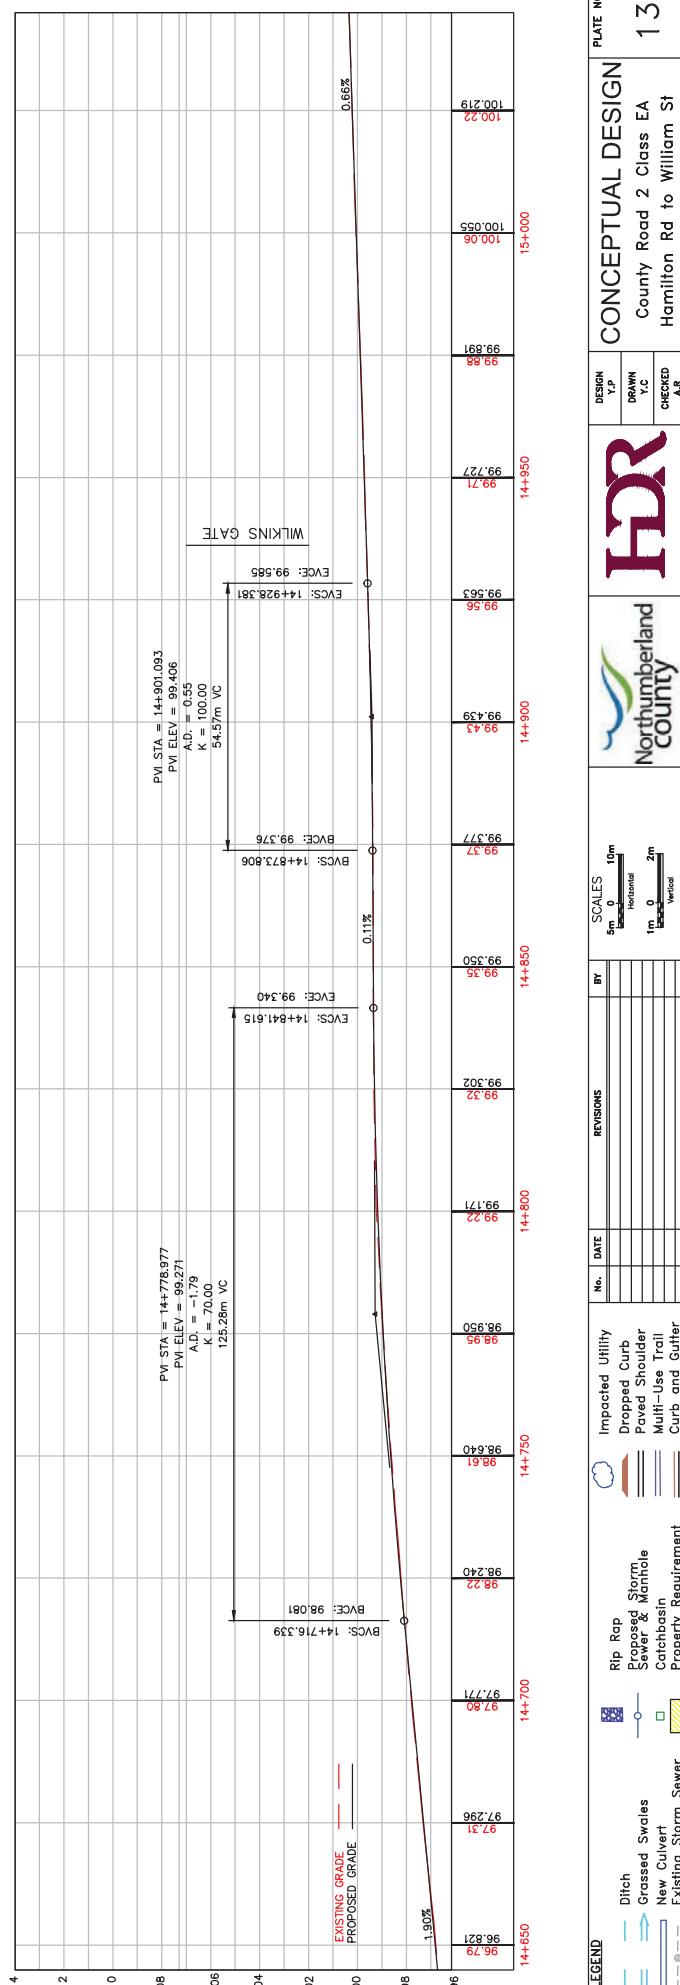

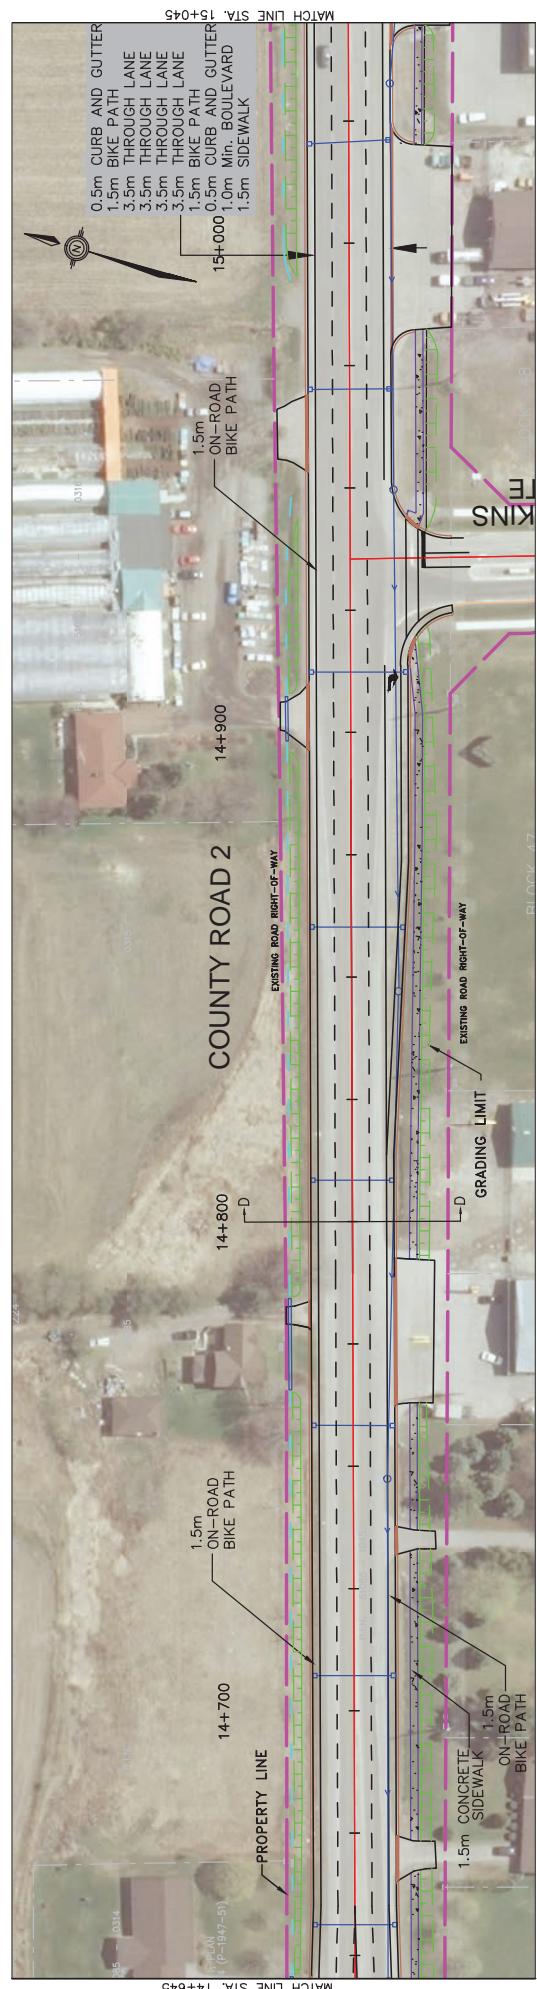

The future traffic conditions were forecast for 2021 and 2031. Using the same methodology for existing conditions and applying a growth rate of 1.8% per annum, future traffic volumes were forecast and analyzed. The 1.8% per annum growth rate was modelled based on existing travel demand on County Road 2, which is considered a more representative estimate for the study corridor than using aggregated population forecasts for the entire County.

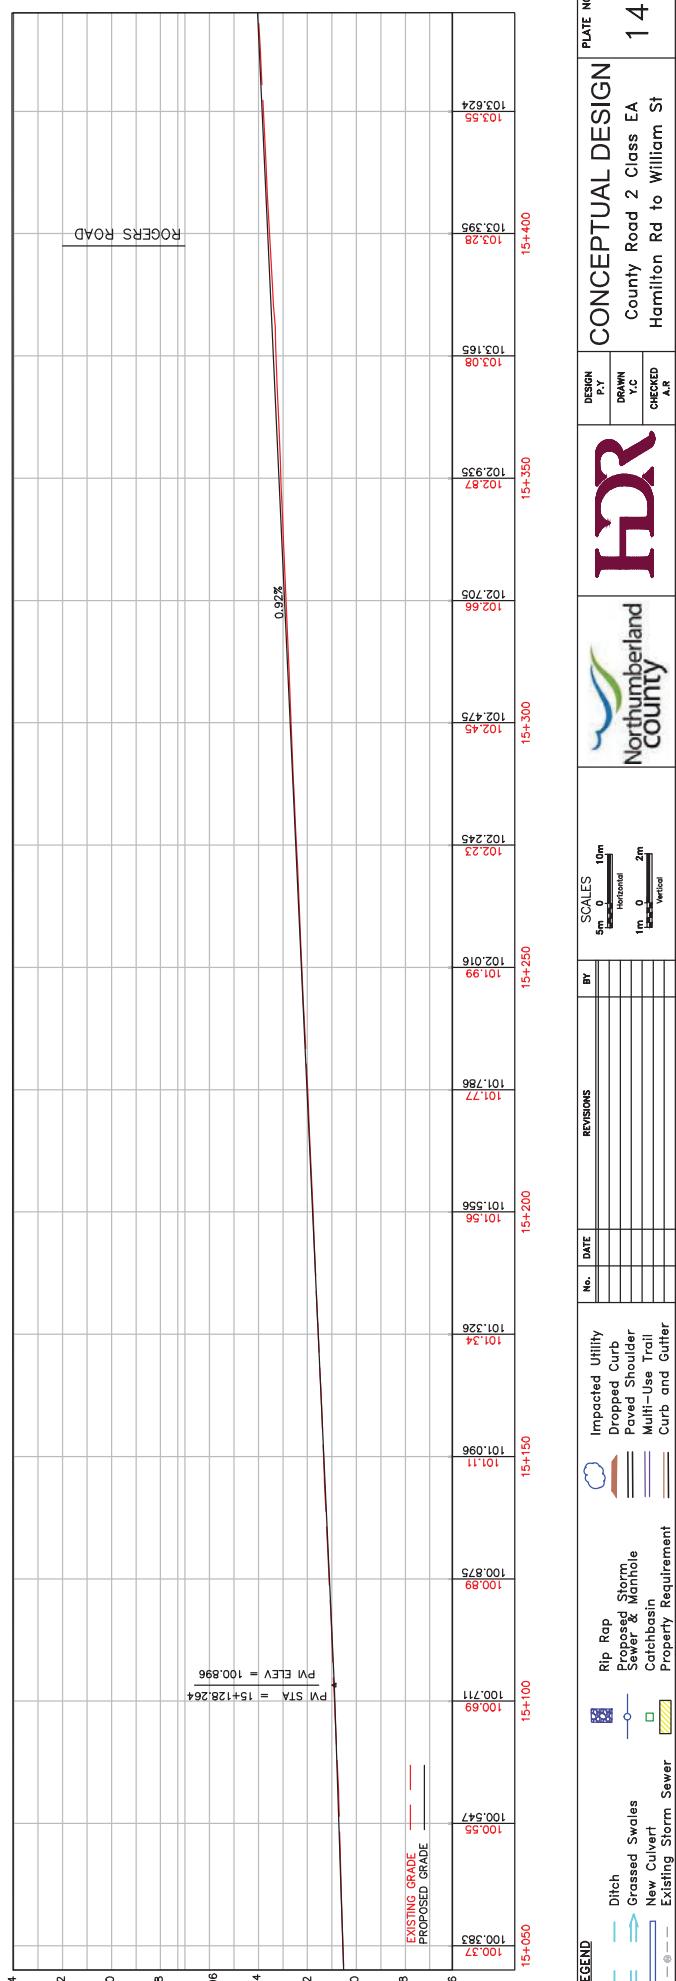

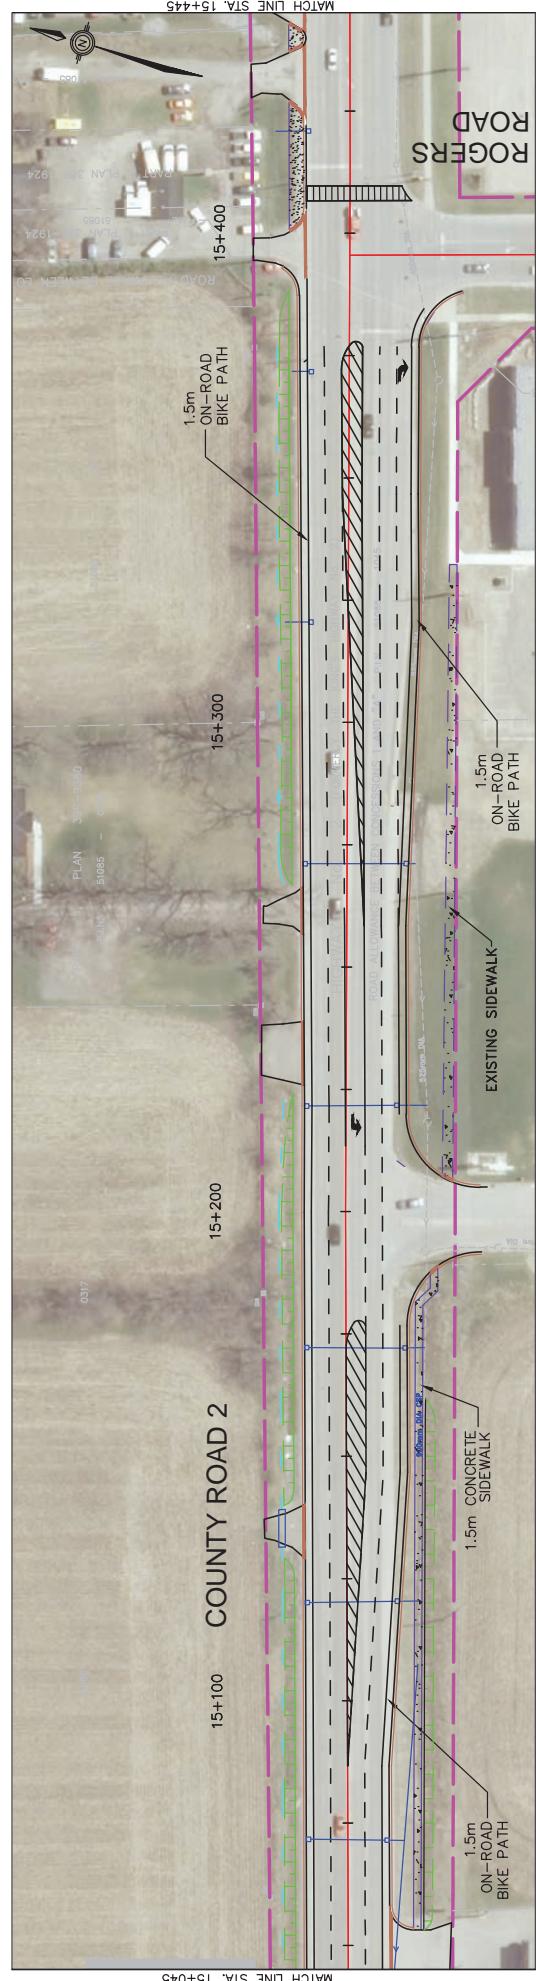

#### **2.1.3.1 2031 AADT Forecasts**

With 1.8% growth rate maintained over the next 20 years, the AADT traffic will increase by 175% and County Road 2 will approach the 0.85 volume to capacity threshold in the PM peak period from 2:00PM to 4:00PM. This is shown in **Table 2-2**.

#### **2.1.3.2 2031 SADT Forecasts**

The assessment of the SADT traffic reveals a similar pattern. A 1.8% growth rate was applied to the SADT conditions for the 2031 traffic forecast as presented in **Table 2-3**. The 2031 summer traffic forecast shows deterioration in traffic performance. County Road 2 will be congested in the afternoon peak period from 12:00 to 4:00 PM with the volume to capacity ratios reaching 0.88, which just exceeds the 0.85 threshold at the end of the 20 year horizon.

## **APPENDIX E**

### Level of Service Definitions

## **LEVEL OF SERVICE ANALYSIS AT SIGNALIZED INTERSECTIONS**

To assist in clarifying the arithmetic analysis associated with traffic engineering, it is often useful to refer to “Level of Service”. The term Level of Service implies a qualitative measure of traffic flow at an intersection. It is dependent upon vehicle delay and vehicle queue lengths at the approaches. Specifically, Level of Service criteria are stated in terms of the average stopped delay per vehicle for a 15-minute analysis period. The following table describes the characteristics of each level:

| <u>Level of Service</u> | <u>Features</u>  | <u>Stopped Delay per Vehicle (sec)</u> |
|-------------------------|--|--|
| A                       | At this level of service, almost no signal phase is fully utilized by traffic. Very seldom does a vehicle wait longer than one red indication. The approach appears open, turning movements are easily made and drivers have freedom of operation.   | $\leq 5.0$                             |
| B                       | At this level, an occasional signal phase is fully utilized and many phases approach full use. Many drivers begin to feel somewhat restricted within platoons of vehicles approaching the intersection.  | $> 5.0 \text{ and } \leq 15.0$         |
| C                       | At this level, the operation is stable though with more frequent fully utilized signal phases. Drivers feel more restricted and occasionally may have to wait more than one red signal indication, and queues may develop behind turning vehicles. This level is normally employed in urban intersection design.         | $> 15.0 \text{ and } \leq 25.0$        |
| D                       | At this level, the motorist experiences increasing restriction and instability of flow. There are substantial delays to approaching vehicles during short peaks within the peak period, but there are enough cycles with lower demand to permit occasional clearance of developing queues and prevent excessive backups. | $> 25.0 \text{ and } \leq 40.0$        |
| E                       | At this level, capacity is reached. There are long queues of vehicles waiting upstream of the intersection and delays to vehicles may extend to several signal cycles.   | $> 40.0 \text{ and } \leq 60.0$        |
| F                       | At this level, saturation occurs, with vehicle demand exceeding the available capacity.  | $> 60.0$                               |

## **LEVEL OF SERVICE ANALYSIS AT UNSIGNALIZED INTERSECTIONS<sup>(1)</sup>**

The term "level of service" implies a qualitative measure of traffic flow at an intersection. It is dependent upon the vehicle delay and vehicle queue lengths at approaches. The level of service at unsignalized intersections is often related to the delay accumulated by flows on the minor streets, caused by all other conflicting movements. The following table describes the characteristics of each level.

| <b>Level of Service</b> | <b>Features</b>  |
|-------------------------|--|
| A                       | Little or no traffic delay occurs. Approaches appear open, turning movements are easily made, and drivers have freedom of operation.   |
| B                       | Short traffic delays occur. Many drivers begin to feel somewhat restricted in terms of freedom of operation.   |
| C                       | Average traffic delays occur. Operations are generally stable, but drivers emerging from the minor street may experience difficulty in completing their movement. This may occasionally impact on the stability of flow on the major street.                                   |
| D                       | Long traffic delays occur. Motorists emerging from the minor street experience significant restriction and frustration. Drivers on the major street will experience congestion and delay as drivers emerging from the minor street interfere with the major through movements. |
| E                       | Very long traffic delays occur. Operations approach the capacity of the intersection.  |
| F                       | Saturation occurs, with vehicle demand exceeding the available capacity. Very long traffic delays occur.   |
